Increased Security for Clickjacking + New Reporting

This release strengthens security efforts that prevent clickjacking attempts. Also, we are implementing new reports to assist associations with child care capacity, availability, and returns manager events.

Clickjacking Security

As technology becomes more sophisticated so does fraud. Clickjacking is defined as "a malicious technique of tricking a user into clicking on something different from what the user perceives, thus potentially revealing confidential information or allowing others to take control of their computer while clicking on seemingly innocuous objects, including web pages." Essentially, an individual or group out to harm individuals through deception could embed part or all of a site as a façade for users, who are unknowingly clicking options on a site behind the one they are seeing. This is a growing concern in technology and we want to respond by adding security for all Daxko Operations associations.

Associations will have access to begin entering approved domains on Wednesday, April 17th. Daxko will begin enforcing the blocking of unknown domains on Wednesday, June 26th. This provides each association with ten weeks to ensure that all valid domains have been added that need access to the Daxko Operations online pages.

New! Child Care Capacity Report

With the recent implementation of Child Care Wait Lists we count capacity in a more complex formula. In order to ensure that each association is able to see capacity by Program, Location, Rate Plan frequency, and Time of Day, we have added a new capacity report accessible from the details page of each program. This report includes an export to Excel option.

New! Child Care Availability Messaging

In order for a staff member to know whether or not to initiate a registration in house, we have added a set of statuses for each location and rate plan. These are high-level statuses across all current and future instances.

Returns Manager Events Added

We added new event logging for adding fees and changing the status of rows in the Returns Manager. These events will insert a record for each of the rows selected to ensure thorough coverage of events.
